# Efficient Data Structures for Massive N-Gram Datasets 

Giulio Ermanno Pibiri<br>University of Pisa and ISTI-CNR<br>Pisa, Italy<br>giulio.pibiri@di.unipi.it

Rossano Venturini<br>University of Pisa and ISTI-CNR<br>Pisa, Italy<br>rossano.venturini@unipi.it

The 40-th ACM SIGIR Conference on Research and Development in Information Retrieval

Tokyo, Japan

10/08/2017

## N-grams - Introduction

Strings of $N$ words.
$N$ typically ranges from 1 to 5 .
Extracted from text using a sliding window approach.

## N-grams - Introduction

Strings of $N$ words.
$N$ typically ranges from 1 to 5 .
Extracted from text using a sliding window approach.

## $N$-grams - Introduction

Strings of $N$ words.
$N$ typically ranges from 1 to 5 .
Extracted from text using a sliding window approach.

# Google Books 

$\approx 6 \%$ of the books ever published

## N-grams - Introduction

Strings of $N$ words.
$N$ typically ranges from 1 to 5 .
Extracted from text using a sliding window approach.

# Google Books 

$\approx 6 \%$ of the books ever published

| $N$ | number of grams |
| :---: | ---: |
| 1 | $24,359,473$ |
| 2 | $667,284,771$ |
| 3 | $7,397,041,901$ |
| 4 | $1,644,807,896$ |
| 5 | $1,415,355,596$ |

More than 11 billion grams.

## N -grams - Challenge

Store massive N -grams datasets in compressed space such that given a pattern, we can return its value efficiently.

## $N$-grams - Challenge

Store massive N -grams datasets in compressed space such that given a pattern, we can return its value efficiently.
$N$-Gram values

## N -grams - Challenge

## Trie Indexing

## Trie Indexing

We need an encoder for integer sequences, supporting fast random Access.

## Trie Indexing

We need an encoder for integer sequences, supporting fast random Access.

Take range-wise prefix sums on gram-ID sequences.

## Trie Indexing

We need an encoder for integer sequences, supporting fast random Access.

Take range-wise prefix sums on gram-ID sequences.

## Trie Indexing

We need an encoder for integer sequences, supporting fast random Access.

Take range-wise prefix sums on gram-ID sequences.

## Elias-Fano Tries

One NextGEQ per level

Constant-time random Access

## Context-based ID Remapping

Observation: the number of words following a given context is small.
High-level idea: map a word ID to the position it takes within its sibling IDs (the IDs following a context of fixed length $k$ ).

## Context-based ID Remapping

Observation: the number of words following a given context is small.
High-level idea: map a word ID to the position it takes within its sibling IDs (the IDs following a context of fixed length $k$ ).

## Context-based ID Remapping

Observation: the number of words following a given context is small.

- Elias-Fano Tries substantially outperform ALL previous solutions in both space and time.
- As fast as the state-of-the-art (KenLM) but more than twice smaller.

## Experimental Analysis - Perplexity

Reversed Elias-Fano Tries

- Probabilities and backoffs are quantized (binning method) using any number of bits from 2 to 32
- Stateful scoring function

## tongrams - Tons of $\boldsymbol{N}$-Grams

tongrams is a C++ library implementing the compressed data structures described in the paper Efficient Data Structures for Massive N-Gram Datasets, by Giulio Ermanno Pibiri and Rossano Venturini, published in ACM SIGIR 2017 [1]. The proposed data structures can be used to map $N$-grams to their corresponding (integer) frequency counts or to (floating point) probabilities and backoffs for backoff-interpolated Knenser-Ney models.

The library features a compressed trie data structure in which $N$-grams are assigned integer identifiers (IDs) and compressed with Elias-Fano (Subsection 3.1 of [1]) as to support efficient searches within compressed space. The context-based remapping of such identifiers (Subsection 3.2 of [1]) permits to encode a word following a context of fixed length $k$, i.e., its preceding $k$ words, with an integer whose value is bounded by the number of words that follow such context and not by the size of the whole vocabulary (number of uni-grams). Additionally to the trie data structure, the library allows to build models based on minimal perfect hashing (MPH), for constant-time retrieval (Section 4 of [1]).

When used to store frequency counts, the data structures support a lookup() operation that returns the number of occurrences of the specified N -gram. Differently, when used to store probabilities and backoffs, the data structures implement a score() function that, given a text as input, computes the perplexity score of the text.

This guide is meant to provide a brief overview of the library and to illustrate its funtionalities through some examples.
