## The Static Ordered Set Problem

Given a set of $n$ items and an order relation defined on them, we are asked to design a data structure that supports Access, Contains, Successor, Predecessor efficiently.

## The Static Ordered Set Problem

Given a set of $n$ items and an order relation defined on them, we are asked to design a data structure that supports Access, Contains, Successor, Predecessor efficiently.

Let us assume our items are integers drawn from some universe of size $u \geq n$.

## The Static Ordered Set Problem

Given a set of $n$ items and an order relation defined on them, we are asked to design a data structure that supports Access, Contains, Successor, Predecessor efficiently.

> Let us assume our items are integers drawn from some universe of size $u \geq n$.

If the integers are not to be compressed: use an array.
Operations are made efficient
by binary search with loop unrolling
with cut-off to SSE/AVX (SIMD) linear search
If the keys are uniformly distributed, interpolation search can help:
$\mathrm{O}(\log \log n)$ time with high probability. on small segments.

## The Static Ordered Set Problem

Given a set of $n$ items and an order relation defined on them, we are asked to design a data structure that supports Access, Contains, Successor, Predecessor efficiently.

> Let us assume our items are integers drawn from some universe of size $u \geq n$.

If the integers are not to be compressed: use an array.
Operations are made efficient
by binary search with loop unrolling
with cut-off to SSE/AVX (SIMD) linear search on small segments.

If the keys are uniformly distributed, interpolation search can help:
$\mathrm{O}(\log \log n)$ time with high probability.

Let us also assume $n$ is so big that we must compress the set.

## Partitioning by Cardinality

The problem of (almost all) such representations is that
Access, Contains, Predecessor/Successor are not natively supported, but we can just
decode sequentially.

## Partitioning by Cardinality

The problem of (almost all) such representations is that
Access, Contains, Predecessor/Successor are not natively supported, but we can just decode sequentially.

## Solution 1

Introduce some redundancy to accelerate queries: the so-called skip pointers.

## Partitioning by Cardinality

The problem of (almost all) such representations is that
Access, Contains, Predecessor/Successor are not natively supported, but we can just decode sequentially.

Solution 1
Introduce some redundancy to accelerate queries: the so-called skip pointers.

B

## Partitioning by Cardinality

The problem of (almost all) such representations is that
Access, Contains, Predecessor/Successor are not natively supported, but we can just
decode sequentially.

Solution 1
Introduce some redundancy to accelerate queries: the so-called skip pointers.

B

## Partitioning by Cardinality

The problem of (almost all) such representations is that
Access, Contains, Predecessor/Successor are not natively supported, but we can just
decode sequentially.

## Solution 1

Introduce some redundancy to accelerate queries: the so-called skip pointers.

Upperbounds

## Partitioning by Universe

Assume a slice size of $\mathbf{2}^{\mathbf{3}}$

## Partitioning by Universe

Assume a slice size of $\mathbf{2}^{\mathbf{3}}$

## Contains(x):

$i=x \gg 3$
search for $x-(i \ll 3)$ in the $i-t h$ slice

## Partitioning by Universe

Assume a slice size of $\mathbf{2}^{\mathbf{3}}$

Contains(x): $\quad x=010101$
$i=x \gg 3$
search for $x-(i \ll 3)$ in the $i-t h$ slice

## Partitioning by Universe

Assume a slice size of $\mathbf{2}^{\mathbf{3}}$

Contains(x): $\quad x=010101$
$i=x \gg 3 \quad 010101$
search for $x-(i \ll 3)$ in the $i-t h$ slice

## Partitioning by Universe

Assume a slice size of $\mathbf{2}^{\mathbf{3}}$

Contains(x): $\quad x=010101$
$i=x \gg 3 \quad 010101$
search for $\mathrm{x}-(\mathrm{i} \ll 3)$ in the i -th slice $\mathrm{x}-16=5$

## Partitioning by Universe

Assume a slice size of $\mathbf{2}^{\mathbf{3}}$

Contains(x): $\quad x=010101$
$i=x \gg 3 \quad 010101$
search for $\mathrm{x}-(\mathrm{i} \ll 3)$ in the i -th slice $\mathrm{x}-16=5$

Successor(x):
$i=x \gg 3$
search for successor of $x-(i \ll 3)$ in the $i-t h$ slice
(if i-th slice is empty or $x-(i \ll 3)>$ max_value in $i$-th slice, then return first value on the right)

## Partitioning by Universe

Assume a slice size of $\mathbf{2}^{\mathbf{3}}$

Contains(x): $\mathrm{x}=010101$
$i=x \gg 3 \quad 010101$
search for $\mathrm{x}-(\mathrm{i} \ll 3)$ in the i -th slice $\mathrm{x}-16=5$

Successor(x):
$i=x \gg 3$
search for successor of $x-(i \ll 3)$ in the $i-t h$ slice
(if i-th slice is empty or $x-(i \ll 3)>$ max_value in $i$-th slice, then return first value on the right)

Intersection between lists has to intersect only the slices in common between the lists.

## Bitmaps

Good old data structure for storing dense sets: $x$-th bit is set if integer $x$ is in the set.

## Bitmaps

Good old data structure for storing dense sets:
$x$-th bit is set if integer $x$ is in the set.

$$
S=\{0,1,5,7,8,10,11,14,18,21,22,28,29,30\}
$$

## Bitmaps

Good old data structure for storing dense sets:
$x$-th bit is set if integer $x$ is in the set.

$$
S=\{0,1,5,7,8,10,11,14,18,21,22,28,29,30\}
$$

Contains: testing a bit
Successor/Predecessor: __builtin_ctzll
Select: __builtin_ctzll
Max: __builtin_clzll
Min:__builtin_ctzll
Decode: __builtin_ctzll
Insertion: setting a bit
Deletion: clearing a bit

## Bitmaps

Good old data structure for storing dense sets:
$x$-th bit is set if integer $x$ is in the set.

$$
S=\{0,1,5,7,8,10,11,14,18,21,22,28,29,30\}
$$

Contains: testing a bit
Successor/Predecessor: __builtin_ctzll
Select: __builtin_ctzll
Max: __builtin_clzll
Min: __builtin_ctzll
Decode: __builtin_ctzll
Insertion: setting a bit
Deletion: clearing a bit

Nothing is better than a bitmap for dense sets.

## Roaring

Assume $u=2^{32}$
[Lemire et al. 2013]

## Roaring

## Assume $u=2^{32}$

Dense: cardinality > 4096
Sparse: otherwise

Ensure at most 16 bits $\times$ key (excluding overhead)

Dense spans are represented with bitmaps of $2^{16}$ bits.
Sparse spans are represented with sorted-arrays of 16-bit integers.

## Slicing

Assume $u=2^{32}$

Dense slices are represented with bitmaps of $2^{16}$ or $2^{8}$ bits.
Sparse slices are represented with sorted-arrays of 8-bit integers.

## Intersection

Intersection between lists has to intersect only the slices in common between the lists.

- Dense vs. Dense (Bitmap vs. Bitmap):
bitwise AND operations + (usually) automatic compiler vectorization
- Dense vs. Sparse (Bitmap vs. Array):

Given the array A: check if bit A [i] is set in the bitmap

- Sparse vs. Sparse (Array vs. Array):

Vectorized processing using _mm_cmpestrm and _mm_shuffle_epi8 SIMD instructions

## Summing up

## 2 different paradigms

Partitioning by Cardinality (PC)

Partitioning by Universe (PU)

## Experimental Comparison - Setting

Datasets

| Statistic | Gov2 | CW09 | CCNews |
| :---: | :---: | :---: | :---: |
| Lists | 35,636,425 | 92,094,694 | 43,844,574 |
| Universe | 24,622,347 | 50,131,015 | 43,530,315 |

## Configurations

| Method | Shorthand | Strategy |
| :---: | :---: | :---: |
| Variable-Byte | V | PC; fixed-sized partitions of 128 integers; byte-aligned |
| Elias-Fano | EF | PC; fixed-sized partitions of 128 integers; bit-aligned |
| Interpolative | BIC | PC; fixed-sized partitions of 128 integers; bit-aligned |
| Elias-Fano $\epsilon$-opt. | PEF | PC; variable-sized partitions; bit-aligned |
| Roaring without run opt. | R2 | PU; single-span; 2 container types; byte-aligned |
| Roaring with run opt. | R3 | PU; single-span; 3 container types; byte-aligned |
| Slicing | S | PU; multi-span; byte-aligned |

## Experimental Comparison - Compression Effectiveness

bits per integer

| Method | $d=10^{-2}$ |  |  | $d=10^{-3}$ |  |  | $d=10^{-4}$ |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Gov2 | CW09 | CCNews | Gov2 | CW09 | CCNews | Gov2 | CW09 | CCNews |
| V | 8.60 | 8.72 | 8.66 | 8.72 | 9.00 | 9.08 | 8.85 | 9.19 | 9.28 |
| EF | 2.72 | 4.44 | 4.72 | 3.25 | 5.14 | 5.37 | 3.65 | 5.56 | 5.66 |
| BIC | 2.33 | 3.59 | 4.37 | 2.72 | 4.11 | 4.97 | 3.02 | 4.41 | 5.24 |
| PEF | 2.37 | 4.01 | 4.52 | 2.85 | 4.62 | 5.16 | 3.20 | 4.96 | 5.45 |
| R2 | 6.00 | 8.88 | 8.25 | 7.03 | 9.99 | 9.21 | 7.60 | 10.47 | 9.53 |
| R3 | 5.33 | 8.49 | 8.22 | 6.25 | 9.40 | 9.17 | 6.75 | 9.75 | 9.48 |
| S | 3.23 | 5.44 | 5.98 | 3.91 | 6.39 | 7.18 | 4.46 | 7.00 | 7.77 |

PC-based methods, such as BIC and PEF, are best for space usage. Slicing (PU-based) stands in trade-off position.

## Experimental Comparison - Sequential Decoding Time

ns per integer

| Method | $d=10^{-2}$ |  |  | $d=10^{-3}$ |  |  | $d=10^{-4}$ |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Gov2 | CW09 | CCNews | Gov2 | CW09 | CCNews | Gov2 | CW09 | CCNews |
| V | 0.51 | 0.61 | 0.53 | 0.55 | 0.66 | 0.59 | 0.58 | 0.71 | 0.62 |
| EF | 0.87 | 1.29 | 1.36 | 0.94 | 1.34 | 1.41 | 0.98 | 1.36 | 1.42 |
| BIC | 5.26 | 6.73 | 7.71 | 5.54 | 6.95 | 7.86 | 5.70 | 7.01 | 7.90 |
| PEF | 0.78 | 1.15 | 1.34 | 0.86 | 1.22 | 1.48 | 0.91 | 1.25 | 1.53 |
| R2 | 0.53 | 0.72 | 0.68 | 0.53 | 0.70 | 0.69 | 0.54 | 0.71 | 0.69 |
| R3 | 0.55 | 0.76 | 0.70 | 0.55 | 0.76 | 0.69 | 0.57 | 0.78 | 0.70 |
| S | 0.56 | 0.67 | 0.65 | 0.57 | 0.69 | 0.67 | 0.60 | 0.73 | 0.71 |

PU-based methods, are as fast as the fastest (vectorized) PC-based methods.

## Experimental Comparison - Intersection Time

musec per intersection

| Method | $d=10^{-2}$ |  |  | $d=10^{-3}$ |  |  | $d=10^{-4}$ |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Gov2 | CW09 | CCNews | Gov2 | CW09 | CCNews | Gov2 | CW09 | CCNews |
| V | 3648 | 6671 | 16954 | 710 | 1591 | 3732 | 40 | 214 | 523 |
| EF | 4652 | 8356 | 22818 | 856 | 1700 | 4455 | 40 | 192 | 530 |
| BIC | 12169 | 23608 | 58349 | 2649 | 6377 | 14765 | 160 | 905 | 2323 |
| PEF | 4380 | 7920 | 21710 | 826 | 1640 | 4185 | 40 | 190 | 490 |
| R2 | 377 | 598 | 1138 | 99 | 232 | 353 | 10 | 57 | 98 |
| R3 | 503 | 962 | 1338 | 128 | 331 | 395 | 13 | 75 | 115 |
| S | 507 | 1080 | 2370 | 135 | 378 | 820 | 11 | 60 | 159 |

PU-based methods outperform PC-based methods.

## Experimental Comparison - Point Queries

Access: ns per query

| Method | $d=10^{-2}$ |  |  | $d=10^{-3}$ |  |  | $d=10^{-4}$ |  |  |
